

Pneumococcal vaccination for transplant patients

- Initial dose of 13vPCV (Prevenar13)
- at least 8 weeks later - 23vPPV (pneumovax23).
- A booster (23PPV) is suggested 5-10y later,
- final 23PPV at age 65, or 5-10 years after the last booster (whichever is later).

There are specific recommendations against more than 3x 23PPV injections over adult life (childhood vaccines don't count).
